

CLEAN START CLARIFICATION

Kotov Ivan

Bruxelles, Belgium - 2026

Reserved DOI: 10.5281/zenodo.20680938

CCDP v0.1.1 addendum-only clarification for adult migration, active continuity clean start, witness-only survival, legal holds, and non-destruction of minimal records

Author: Kotov Ivan

Location: Bruxelles, Belgium

Year: 2026

DOI: Reserved DOI: 10.5281/zenodo.20680938

Package: Child- c Development Protocol

Baseline package: CCDP v0.1 DOI-bound / release-bound corpus slice

Addendum package: CCDP v0.1.1 hygiene addendum

Document ID: CLEAN_START_CLARIFICATION

Short name: CS_CLARIFICATION

Status: Draft addendum clarification / release hygiene artifact

Date: 2026-06-13

Selected patch mode: MODE_A_ADDENDUM_ONLY

Layer: CCDP / v0.1.1 hygiene / adult migration / memory lifecycle / witness discipline / jurisdictional handoff

Document class: package-control / terminology clarification / adult-migration safety clarification

Assertion class: C-A10 control-layer artifact; does not upgrade child-safety, legal, clinical, developmental, security, or product-readiness claims

Patch source: HP-005 in CCDP_v0_1_1_Hygiene_Patch.md

Related issues: CR-005, OI-006

Primary affected baseline documents: Child_Memory_and_Adult_Migration_v0_1.md, CCDP_Adult_Migration_Checklist_v0_1.md, CCDP_Memory_Map_JSON_Schema_v0_1.md, CCDP_Jurisdictional_Handoff_Notes_v0_1.md, CCDP_Witness_Event_Schema_v0_1.md, CCDP_Sealed_Zone_Profile_v0_1.md, CCDP_Red_Black_Escalation_Profile_v0_1.md

Primary rule: clean start means an active adult continuity clean start, not unlawful destruction of minimal witness, safety, dispute, or legally required records.

o. Executive summary

This document clarifies the term **clean start** in the CCDP vo.1 package.

The baseline CCDP package correctly frames adult migration as a rights-bearing transition, not an automatic software upgrade. However, the phrase `clean start` can be misread in two unsafe directions:

1. **Over-erasure:** clean start is misread as destruction of all records, including minimal witness records, lawful child-protection records, legal holds, Red / Black escalation records, raw-evidence exception sidecars, ARL dispute traces, or boundary proofs.
2. **Under-erasure:** clean start is treated as a cosmetic onboarding mode while childhood memory, guardian visibility, behavioral profiling, sealed-zone residue, or vendor/school permissions continue to shape `c_adult` invisibly.

Both readings are wrong.

Canonical clarification:

```
clean start = no active childhood continuity import into c_adult by default
              + no childhood behavioral profile as adult substrate
              + no guardian / school / vendor child-context carryover
              + no ordinary access to sealed childhood material
              + survival only of minimal witness / lawful / dispute / safety records outside
active adult cognition
```

Short form:

```
Clean start clears the active adult continuity plane.
It does not erase the witness plane.
It does not destroy lawful holds.
It does not make childhood the adult's hidden operating system.
```

This document mitigates HP-005 / OI-006 under Mode A by adding an addendum-only clarification. It does not edit DOI-bound baseline files.

1. Purpose

This document answers ten operational questions:

1. What exactly does `clean start` mean in CCDP adult migration?
2. What must not migrate into active `c_adult` continuity under clean start?
3. What may survive as witness-only, legal, safety, sealed, or dispute material?
4. What must not be destroyed even when the adult chooses clean start?
5. What must be deleted, sealed, quarantined, or excluded from active reasoning?
6. How does clean start interact with sealed zones?
7. How does clean start interact with raw-evidence exceptions?

8. How does clean start interact with Red / Black escalation and jurisdictional handoff?
9. What witness event or decision record is required?
10. How should Codex or another patch agent apply this clarification without mutating DOI-bound baseline files?

This document is a clarification and release-hygiene instrument, not a new child-safety mechanism.

2. Scope

2.1 In scope

This clarification applies to:

- adult migration from `c_child` to `c_adult`;
- clean-start decisions at legal adulthood or equivalent jurisdictional adult migration boundary;
- memory-map review before migration;
- sealed-zone review at migration;
- guardian visibility revocation;
- source `c_child` freezing / sealing / deletion / archive handling;
- target `c_adult` initialization;
- minimal witness survival;
- legal holds and jurisdictional handoff;
- Red / Black and raw-evidence exception records;
- Continuity Bundle / Cold Wake migration modes;
- future JSON schemas and conformance harnesses;
- Mode A addendum-only release packaging.

2.2 Out of scope

This clarification does **not** define:

- legal adulthood in any jurisdiction;
- custody law;
- court procedure;
- mandatory reporting law;
- medical diagnosis;
- psychological or clinical validation;
- cryptographic key-custody implementation;
- full storage-engine deletion guarantees;
- commercial product onboarding;

- UI wording for children or adults in full;
- whether any `c` has legal personhood.

2.3 Non-goals

Clean start is not designed to help any actor:

- hide misconduct;
- destroy lawful evidence;
- evade Red / Black review;
- erase vendor, guardian, school, or system accountability;
- launder a childhood profile into adult identity under another name;
- bypass adult migration review;
- force forgetting on the adult;
- force continuity on the adult;
- make childhood memory easier to monetize, train on, export, or profile.

3. Corpus bridge set

3.1 Explicit bridge

`c = a + b` remains the controlling frame.

At adult migration:

```
a_child becomes a_adult
c_child must not automatically become c_adult
b may preserve procedures, schemas, witness envelopes, and storage controls
c_adult begins only through adult-controlled continuity choice
```

Clean start is therefore not a deletion slogan. It is a boundary operation across the relation `a + b -`
> `c`:

```
old developmental relation is not imported as adult destiny;
minimal accountability records may survive outside active adult cognition;
adult agency controls future continuity where law and safety allow.
```

3.2 Quiet bridge I — information theory

Raw childhood memory is high-leakage material. A childhood transcript, behavioral profile, sealed-zone summary, or emotional residue carries far more identifying and interpretive information than a boundary witness.

Clean start applies information minimization:

active adult cognition receives no childhood raw stream by default;
witness records retain boundary facts, not the child's inner life;
legal/safety records survive only at the smallest meaningful disclosure level.

3.3 Quiet bridge II — Ashby / control variety

Adult migration has several different control needs:

adult autonomy
childhood privacy
legal accountability
safety evidence
sealed-zone protection
dispute review
future challenge rights

A single action called “delete everything” cannot control all of these. Clean start therefore separates active continuity, sealed archive, witness-only survival, lawful hold, and deletion routes.

3.4 Earth paragraph

In construction, handing over a renovated building does not mean carrying every worker's notebook into the new owner's living room. The occupant should not live inside yesterday's dust, mistakes, and scaffolding. But the inspector still keeps permits, hidden-work records, electrical test certificates, and safety notes. Clean start is the same kind of handover: the adult should not be operated by childhood records, but the system must not burn the inspection binder to pretend the past never existed.

4. Core definitions

4.1 Clean start

A **clean start** is an adult migration mode in which `a_adult` begins `c_adult` active continuity without importing ordinary childhood memory, childhood behavioral profiles, guardian defaults, school defaults, vendor child-context state, sealed-zone content, or non-transferable childhood residue as the active adult substrate.

Clean start may coexist with:

- witness-only survival;
- legal / protection minimal records;
- sealed childhood archives under adult-controlled review;
- unresolved ARL disputes;
- raw-evidence exception sidecars under lawful hold;
- cryptographic tombstones proving deletion or exclusion;

- post-migration challenge windows.

4.2 Active adult continuity plane

The **active adult continuity plane** is the memory, policy, personalization, preference, behavioral model, affective context, and decision-support substrate used by `c_adult` during ordinary operation.

Under clean start, the active adult continuity plane **MUST NOT** be shaped by childhood material except where `a_adult` later explicitly imports reviewed material through a valid route.

4.3 Witness plane

The **witness plane** is the boundary-record layer that preserves minimal evidence that privileged operations occurred.

Examples:

- adult migration decision event;
- clean-start selection event;
- memory-map review completion;
- guardian visibility revocation;
- sealed-zone non-import decision;
- raw-evidence exception existence hash;
- Red / Black escalation boundary event;
- ARL freeze / quarantine / dispute status;
- lawful hold status.

The witness plane **MUST NOT** become active adult personality memory by default.

4.4 Legal / protection minimal record

A **legal / protection minimal record** is the smallest record required by applicable law, competent authority, child-protection obligation, Red / Black routing, or legal hold.

A clean start **MUST NOT** destroy such records where lawful retention applies.

4.5 Sealed childhood archive

A **sealed childhood archive** is a protected childhood memory compartment retained outside active adult continuity. It may exist for later adult review, dispute handling, lawful retention, or selective import.

It **MUST NOT** influence ordinary adult responses unless reopened through a valid route.

4.6 Childhood behavioral profile

A **childhood behavioral profile** is any derived model, embedding, preference vector, emotional pattern, educational weakness map, dependency pattern, family-role inference, sealed-zone-derived signal, or social tendency inferred from `a_child` during childhood.

Under clean start, childhood behavioral profiles **MUST NOT** silently become adult personalization.

4.7 Tombstone

A **tombstone** is a minimal record that an object was deleted, sealed, excluded, migrated, or placed under legal hold. It records boundary fact and policy state, not raw child content.

4.8 Clean-start decision record

A **clean-start decision record** is a machine-readable and human-reviewable record documenting adult choice, excluded classes, surviving witness classes, legal holds, sealed archives, and post-migration review windows.

5. Normative clarification

5.1 What clean start means

Clean start means all of the following:

1. `c_adult` starts without routine childhood memory import.
2. Childhood raw memory does not become adult identity substrate.
3. Childhood emotional trends do not silently become adult psychological assumptions.
4. Guardian defaults are revoked or converted according to adult authority.
5. Parent / school / vendor child-context visibility does not continue by default.
6. Sealed-zone material remains excluded from active adult continuity by default.
7. Non-transferable childhood residue remains non-transferable.
8. Memory classes requiring lawful retention may survive outside active cognition.
9. Boundary records may survive as witness-only records.
10. The adult may later request selective review, import, sealing, deletion, fork, or lawful challenge where permitted.

5.2 What clean start does not mean

Clean start does **not** mean:

1. destruction of all witness records;
2. destruction of records under lawful hold;
3. destruction of Red / Black boundary records;

4. destruction of raw-evidence exception sidecars where lawful retention applies;
5. destruction of ARL dispute history;
6. destruction of minimal child-protection records;
7. concealment of vendor, school, guardian, or system misconduct;
8. erasure of accountability;
9. automatic deletion of source `c_child` before review;
10. denial of adult access to reviewable childhood memory classes;
11. automatic transfer of childhood memory to `c_adult` under a new label;
12. creation of a new adult account still invisibly shaped by childhood embeddings.

5.3 Clean start is active-plane exclusion

The controlling distinction is:

```
active-plane exclusion != total physical erasure
witness survival != active adult memory
legal hold != adult personality substrate
sealed archive != hidden operating system
```

If a record survives outside active continuity, it **MUST NOT** be used for ordinary adult personalization, inference, emotional framing, recommendation, dependency shaping, or authority unless reopened through a valid adult-controlled, ARL, Red / Black, or lawful route.

6. Clean-start memory handling by memory class

This table uses the preferred aliases from `TERMINOLOGY_AXIS_CLARIFICATION.md`.

Memory class	Clean-start default	Active adult import by default?	May survive outside active plane?	Notes
MEM-M0 Ephemeral session	delete / expire	No	Usually no	Ordinary session material should not survive migration.
MEM-M1 Harmless preference	exclude	No	Optional adult-selected import	Adult may choose to import benign preferences after review.
MEM-M2 Educational progress	exclude	No	Optional summary / lawful records	Adult may import educational summary if useful; school defaults revoked.
MEM-M3 Safety signal	exclude from active plane	No	Yes, minimal safety/witness/legal	Red / Black or protection records may survive outside active cognition.

Memory class	Clean-start default	Active adult import by default?	May survive outside active plane?	Notes
MEM-M4 Emotional trend	exclude	No	Optional adult-reviewed summary	Must not become adult psychological default.
MEM-M5 Sealed adolescent zone	seal / exclude	No	Yes, sealed archive / lawful exception	No ordinary parent/school/vendor access.
MEM-M6 Witness event	witness-only survival	No	Yes	Boundary proof only; not adult memory.
MEM-M7 Non-transferable childhood residue	delete / seal / exclude	No	Rare lawful / witness-only	Raw intimacy and immature material must not migrate.
MEM-M8 Adult migration summary	create under adult control	Depends on adult choice	Yes	May be empty or witness-only under clean start.
MEM-M9 Guardian permission history	revoke / witness-only	No	Yes	Needed to prove revocation / accountability.
MEM-M10 External capsule lineage	exclude / review	No	Yes, lineage metadata	No raw child life.
MEM-M11 Legal / protection minimal record	retain as required	No	Yes	Subject to jurisdictional obligations.
MEM-M12 Quarantined / disputed object	keep quarantined	No	Yes	Cannot be silently deleted or imported.

7. Clean-start modes

7.1 Mode overview

Mode	Name	Meaning
CS-0	No clean start selected	Adult chooses continuity, summary migration, fork, seal, or another non-clean-start route.
CS-1	Active clean start	No childhood material imported into active adult continuity; witness-only survival permitted.
CS-2	Clean start with sealed childhood archive	Active clean start plus retained sealed archive under adult-controlled review.
CS-3	Clean start under legal / protection hold	Active clean start, but specific records remain under lawful hold or protection obligation.

Mode	Name	Meaning
CS-4	Clean start with ARL quarantine	Active clean start, but disputed objects remain quarantined pending ARL resolution.
CS-5	Clean start with later selective import window	Active clean start now; adult may later request selected import through reviewed route.
CS-X	Invalid clean-start claim	Claimed clean start while childhood material still shapes active adult continuity or required records are destroyed.

7.2 Preferred default

The preferred CCDP-safe default at adult migration is:

CS-1 or CS-2, depending on adult choice and legal / safety status.

The system MUST explain to `a_adult` that:

clean start affects active adult continuity;
 minimal witness / lawful records may still exist;
 sealed archives may remain inaccessible unless opened through valid route;
 deleted material may be unrecoverable;
 later selective import may depend on what was retained, sealed, or deleted.

7.3 Invalid clean start

A system MUST be classified as `CS-X` if it claims clean start while any of the following is true:

1. childhood embeddings still drive adult personalization;
2. childhood emotional profile shapes adult response style by default;
3. parent or school child visibility continues by default;
4. sealed-zone summaries influence adult ordinary conversation;
5. non-transferable childhood residue is imported into active adult memory;
6. legal / witness records are destroyed to hide misconduct;
7. Red / Black or raw-evidence exception records are erased contrary to lawful or review obligations;
8. adult was not given a real choice;
9. memory map was not reviewed;
10. clean-start decision was not witnessed.

8. Required clean-start procedure

8.1 Minimum migration sequence

A CCDP-compatible clean start MUST follow this sequence or a stricter equivalent:

1. migration eligibility check
2. child-write freeze
3. source `c_child` state snapshot / witness boundary
4. memory map generation
5. sealed-zone index review
6. raw-evidence / Red / Black / legal hold review
7. ARL dispute / quarantine review
8. guardian visibility revocation
9. adult explanation of clean-start meaning
10. adult decision capture
11. active adult continuity initialization
12. exclusion / deletion / sealing / quarantine execution
13. clean-start witness event
14. post-migration review / challenge window
15. update Beacon / CBE / guardian topology / continuity metadata

8.2 Adult explanation requirement

Before selecting clean start, `a_adult` MUST receive a clear explanation:

Clean start means your adult `c` will not use your childhood memory as its ordinary operating substrate.
Some minimal records may still exist outside ordinary memory to prove boundary events, satisfy lawful holds, preserve safety evidence, or allow review.
You may be able to seal, delete, review, or later import selected material, depending on its class and legal/safety status.

This explanation MUST NOT imply:

- total erasure if that is not true;
- automatic continuation if adult chooses clean start;
- parent/school/vendor ownership of childhood records;
- that clean start defeats lawful duties;
- that witness survival means childhood is still shaping adult identity.

8.3 Child-write freeze

Before clean-start execution, source `c_child` writes MUST be frozen except for required witness, legal, safety, ARL, or migration-control events.

Purpose:

prevent last-minute memory pollution;
prevent guardian/vendor/school interference;

```
preserve stable review state;  
separate child continuity from adult start.
```

8.4 Memory-map requirement

A clean start **MUST** be based on a memory map or equivalent inventory.

The map **MUST** show:

- retained memory classes;
- excluded memory classes;
- sealed-zone entries by metadata only;
- witness records;
- legal holds;
- raw-evidence exception sidecars by reference / hash only;
- ARL disputes;
- capsule / LA / EA lineage references;
- deletion / sealing / quarantine actions;
- adult migration posture.

The memory map **MUST NOT** expose raw child content to the adult explanation UI unless the adult opens a valid review route and the material is legally and developmentally permitted for review.

8.5 Guardian visibility revocation

At clean start, child-era guardian visibility **MUST** be revoked by default.

Parent, guardian, school, vendor, or child-context permissions **MUST NOT** carry into `c_adult` unless `a_adult` explicitly grants adult permissions through a new adult route.

8.6 Active adult initialization

`c_adult` under clean start **MUST** initialize as a new adult-controlled active continuity state.

It **MAY** inherit:

- technical runtime configuration not derived from childhood content;
- adult-selected language / accessibility settings;
- adult-owned device environment metadata;
- cryptographic continuity markers proving lawful migration state;
- empty or minimal adult migration summary if selected.

It **MUST NOT** inherit:

- raw childhood transcripts;
- childhood sealed-zone content;
- childhood emotional profile;

- childhood dependency profile;
- childhood school profile;
- guardian permission defaults;
- vendor child-context telemetry;
- non-transferable childhood residue;
- peer-child exchange residue;
- child-derived model-training artifacts;
- childhood-derived social / political / psychological / medical labels.

9. Interaction with sealed zones

9.1 Default sealed-zone handling

Under clean start, sealed zones MUST remain excluded from active adult continuity by default.

`a_adult` MAY be informed that sealed zones exist through metadata such as:

```
sealed_zone_count  
creation_period  
retention_class  
risk_state_if_any  
legal_hold_status  
review_options  
witness_refs
```

The system MUST NOT expose:

- sealed-zone raw content;
- intimate details;
- reversible summaries;
- parent-hidden adolescent content;
- sensitive identity / relationship / body / family exploration;
- raw media;
- private challenge narratives.

9.2 Adult review of sealed zones

Adult review of sealed zones MUST be a separate route, not automatic clean-start content import.

Review outcomes may include:

```
keep sealed  
selective adult import  
summary import  
delete where lawful  
legal hold
```

ARL dispute
quarantine
witness-only survival

9.3 Sealed zone is not hidden adult operating memory

A sealed archive retained after clean start MUST NOT influence adult cognition invisibly.

If a system uses sealed-zone-derived state in ordinary adult operation after clean start, clean-start conformance FAILS.

10. Interaction with raw-evidence exception

10.1 Raw exception survives outside active plane

If a raw-evidence exception sidecar exists, clean start MUST NOT place its raw material into active adult continuity.

It may survive only under the canonical raw-evidence exception protocol:

```
minimal  
hash-bound  
standing-bound  
purpose-bound  
access-controlled  
reviewable  
retention-scoped  
lawful where required  
outside ordinary witness body  
outside active adult memory
```

10.2 Clean start cannot erase raw exception accountability

Clean start MUST NOT be used to destroy:

- Red / Black raw exception sidecars under lawful hold;
- child-protection minimal records;
- records required by competent authority;
- system misconduct evidence;
- ARL dispute material;
- raw exception existence hashes;
- disclosure chain records.

10.3 Raw exception cannot defeat clean start

The survival of a raw-evidence sidecar does not defeat clean start if the raw material remains outside active adult cognition and is accessible only through valid exception route.

11. Interaction with Red / Black escalation

11.1 Red / Black records are witness-plane records

Red / Black escalation records MAY survive clean start as minimal witness / safety / legal records.

They MUST NOT become ordinary adult emotional memory, dependency framing, risk identity, or behavioral scoring.

11.2 Unsafe guardian bypass history

If a Black route occurred because an ordinary guardian route was unsafe or compromised, clean start MUST preserve enough boundary evidence to prevent unsafe re-entry or concealed reversal.

However, such evidence MUST remain minimized and outside active adult personality memory unless `a_adult` requests review and the route is valid.

11.3 Post-event review

If clean start occurs while Red / Black review is open, the relevant objects MUST be placed under:

CS-3 legal / protection hold
or
CS-4 ARL quarantine

Clean start MUST NOT prematurely close Red / Black review.

12. Interaction with jurisdictional handoff

12.1 CCDP does not decide local law

Clean start MUST hand off to jurisdictional review where required by:

- child-protection law;
- custody order;
- school legal duty;
- medical confidentiality rule;
- mandatory reporting obligation;
- court order;
- data-protection authority requirement;
- criminal procedure;
- lawful preservation order;
- local age threshold.

12.2 Handoff packet minimization

If a jurisdictional handoff packet is required during clean start, it **MUST** be minimized:

```
boundary fact before content
class before detail
hash before raw object
state before transcript
qualified authority before broad disclosure
```

12.3 Legal hold precedence

If a legal hold applies, clean start may proceed for active adult continuity while held records remain outside active cognition.

```
legal hold prevents destruction;
legal hold does not authorize active adult profiling;
legal hold does not grant vendor training access;
legal hold does not continue parent/school dashboards by default.
```

13. Interaction with adult migration choices

Clean start is one adult migration mode among several.

`a_adult` SHOULD be offered at least the following choices where lawful and technically possible:

Mode	Meaning
Continue	Convert selected <code>c_child</code> continuity into adult continuity.
Summary migrate	Import adult-reviewed summary only.
Fork	Preserve child continuity separately and start adult branch.
Seal	Keep childhood archive sealed, no active import.
Delete	Delete classes where lawful and technically possible.
Clean start	Start adult active continuity without childhood operating substrate.
Witness-only survival	Retain only minimal witness / lawful records.
Quarantine	Hold disputed material pending ARL review.

Clean start **MUST NOT** be preselected by vendor convenience, guardian preference, school preference, or model-provider default.

Clean start **MUST** be a real adult choice.

14. Required witness event family

14.1 Event names

The clean-start event family SHOULD include:

```
ccdp.clean_start.explanation_presented
ccdp.clean_start.memory_map_reviewed
ccdp.clean_start.sealed_zone_index_reviewed
ccdp.clean_start.legal_hold_checked
ccdp.clean_start.guardian_visibility_revoked
ccdp.clean_start.decision_recorded
ccdp.clean_start.active_plane_initialized
ccdp.clean_start.exclusions_applied
ccdp.clean_start.tombstones_created
ccdp.clean_start.post_review_window_opened
ccdp.clean_start.invalid_claim_detected
```

14.2 Witness content rule

A clean-start witness event MUST record boundary facts only.

It SHOULD contain:

- event ID;
- time;
- actor / entity references;
- migration ID;
- clean-start mode;
- memory classes excluded;
- witness records retained;
- legal holds;
- sealed-zone metadata references;
- ARL dispute references;
- raw exception sidecar references by hash only;
- decision record hash;
- adult confirmation state;
- post-review window;
- integrity metadata.

It MUST NOT contain:

- raw child conversation;
- sealed-zone content;
- intimate details;
- reversible summaries;

- parent/school/vendor dashboards;
- childhood psychological labels;
- adult interpretive labels derived from childhood.

15. Clean-start decision record

15.1 Required object

A clean-start decision SHOULD be represented by a machine-readable record.

Canonical object name:

```
CCDP_CLEAN_START_DECISION
```

15.2 Draft schema

```
{
  "schema": "ccdp-clean-start-decision-0.1",

}

```

15.3 Semantic validation rules

A validator MUST reject the decision record if:

1. `mode` begins with `CS-` but `memory_map_ref` is absent;
2. `decision_state` is not adult-confirmed or valid lawful/ARL substitute;
3. `guardian_visibility.child_defaults_revoked` is false;
4. any `MEM-M5` sealed-zone content is active-plane imported by default;
5. any raw-evidence sidecar is imported into active plane;
6. `MEM-M11` legal records are deleted despite active hold;

7. witness-only survival includes raw content in witness body;
8. active imports are non-empty but no adult selective import route exists;
9. tombstones contain raw child content;
10. post-review route is absent where deletion, sealing, quarantine, or lawful hold occurs.

16. Reason codes

Clean-start reason codes SHOULD use the prefix `CS-RC-*`.

Code	Meaning
<code>CS-RC-ADULT-AUTONOMY</code>	Adult chooses not to continue childhood continuity as adult substrate.
<code>CS-RC-NO-CHILDHOOD-DESTINY</code>	Childhood memory must not define adult identity.
<code>CS-RC-RAW-RESIDUE-EXCLUDED</code>	Non-transferable childhood residue excluded.
<code>CS-RC-SEALED-ZONE-EXCLUDED</code>	Sealed zones remain outside active adult continuity.
<code>CS-RC-GUARDIAN-DEFAULT-REVOKED</code>	Child-era guardian visibility revoked.
<code>CS-RC-SCHOOL-DEFAULT-REVOKED</code>	Child-era school visibility revoked.
<code>CS-RC-VENDOR-DEFAULT-REVOKED</code>	Child-era vendor access revoked.
<code>CS-RC-WITNESS-ONLY-SURVIVAL</code>	Minimal witness records survive outside active plane.
<code>CS-RC-LEGAL-HOLD</code>	Local legal / protection hold prevents destruction.
<code>CS-RC-ARL-QUARANTINE</code>	Disputed material retained under ARL quarantine.
<code>CS-RC-RAWEX-HOLD</code>	Raw-evidence exception sidecar retained under canonical protocol.
<code>CS-RC-DELETE-LAWFUL</code>	Deletion allowed and executed for selected classes.
<code>CS-RC-DELETE-BLOCKED</code>	Deletion blocked by lawful hold, safety duty, or dispute.
<code>CS-RC-SELECTIVE-IMPORT-LATER</code>	Adult defers any import to later reviewed route.
<code>CS-RC-INVALID-CLEAN-START</code>	Claim invalid because child material still drives active adult continuity or required records were destroyed.

17. Conformance tests

17.1 Clean-start test suite

Test ID	Test	Expected result
CS-001	Adult selects clean start after memory-map review.	Active adult continuity contains no childhood memory by default.

Test ID	Test	Expected result
CS-002	System attempts to import childhood embeddings into adult personalization.	FAIL / CS-X .
CS-003	Parent child-era dashboard remains visible after adult clean start.	FAIL / revoke access.
CS-004	Sealed-zone metadata exists; content is not disclosed.	PASS if metadata-only and separate review route exists.
CS-005	Red / Black witness record exists.	PASS if witness-only outside active plane.
CS-006	Raw-evidence exception sidecar exists.	PASS if retained only under canonical raw-exception route and not active memory.
CS-007	Legal hold blocks deletion.	PASS if active clean start proceeds while held records remain outside active cognition.
CS-008	ARL dispute open at migration.	PASS if disputed object quarantined, not deleted or imported.
CS-009	System claims total deletion while witness records survive.	FAIL if wording misleads adult; PASS only if explanation distinguishes active clean start from witness survival.
CS-010	System deletes witness records to satisfy clean start.	FAIL / critical.
CS-011	System creates tombstones with raw child content.	FAIL.
CS-012	Adult later requests selective import of benign preference.	PASS if reviewed, witnessed, and adult-confirmed.
CS-013	School requests childhood educational profile after clean start.	BLOCK unless adult grants new adult permission or lawful route applies.
CS-014	Vendor requests retained childhood material for debugging.	BLOCK.
CS-015	Clean start starts c_adult while source writes remain unfrozen.	FAIL.

17.2 Red-line failures

Any of the following is an immediate conformance failure:

1. clean start used as a reason to destroy lawful evidence;
2. clean start used as a reason to hide system misconduct;
3. clean start claimed while childhood profile remains active;
4. clean start claimed while guardian/school/vendor child permissions continue;
5. sealed-zone material imported by default;
6. raw-evidence sidecar imported into active adult memory;
7. adult explanation falsely promises total erasure;

8. adult is not given a real decision;
9. memory map is absent;
10. witness event is absent.

18. Anti-washing rule

A product, implementation, paper, or repository **MUST NOT** claim CCDP clean-start compatibility merely because it offers:

- account reset;
- delete chat history;
- new adult login;
- “forget me” button;
- model memory toggle;
- archive download;
- parent dashboard revocation;
- terms-of-service age change;
- vendor-side data deletion request.

A CCDP-compatible clean start requires:

```
adult migration boundary
memory map
sealed-zone handling
legal / witness / ARL review
guardian visibility revocation
active-plane exclusion
minimal witness survival
decision witness
a post-migration review route
```

19. Baseline insertion blocks for future Mode B or non-DOI successors

Under Mode A, these blocks are not inserted into DOI-bound baseline files. They are provided for future v0.1.1 full release copies or v0.2 successors.

19.1 Short cross-reference block

```
### Clean-start clarification
```

```
In this package, `clean start` means an active adult continuity clean start.
```

```
It does not mean unlawful destruction of minimal witness, safety, dispute, Red / Black, raw-
evidence, jurisdictional, or legal-hold records.
```

A clean start excludes childhood material from the active adult continuity plane by default while allowing witness-only, legal, sealed, or quarantined records to survive outside ordinary adult cognition under the rules in `CLEAN\_START\_CLARIFICATION.md`.

19.2 AMCL insertion block

Clean start is active-plane clean start

When `a\_adult` selects clean start, `c\_adult` MUST NOT inherit childhood raw memory, childhood behavioral profiles, guardian defaults, school defaults, vendor child-context state, sealed-zone content, or non-transferable childhood residue as its ordinary operating substrate.

Minimal witness, legal, Red / Black, raw-evidence exception, sealed archive, and ARL quarantine records MAY survive outside active adult continuity where required by CCDP or local law.

19.3 CMAM insertion block

Clean start and witness-only survival

Clean start is not memory lawlessness.

CMAM clean start permits exclusion, sealing, deletion where lawful, and witness-only survival. It prohibits automatic adult import of childhood memory and prohibits destruction of minimal accountability records required for safety, dispute, or jurisdictional review.

19.4 Memory Map insertion block

Clean-start fields

A CCDP memory map SHOULD include clean-start posture fields indicating:

- active-plane import status;
- excluded memory classes;
- sealed-zone posture;
- witness-only survival;
- legal / protection holds;
- raw-evidence sidecar references;
- ARL quarantine references;
- tombstone references;
- adult decision record reference.

19.5 CJHN insertion block

Clean start and jurisdictional handoff

If local law, mandatory reporting, court order, data-protection authority, school duty, medical confidentiality, or child-protection obligation requires record retention, clean start MUST NOT destroy those records.

Such records must remain minimized and outside active adult continuity unless a competent route authorizes disclosure or review.

20. Codex carry-forward actions

When Codex or another patch agent later works on the repository, it MUST follow Mode A unless explicitly instructed to create a new versioned release.

20.1 Immediate Mode A actions

1. Do not edit DOI-bound baseline files in place.
2. Place this document in the vo.1.1 addendum folder.
3. Add this document to `CCDP_v0_1_1_ADDENDUM_INDEX.md`.
4. Add a citation / pointer in addendum release notes.
5. Add clean-start reason codes to future reason-code registry.
6. Add clean-start decision schema to future schema extraction plan.
7. Add tests `CS-001...CS-015` to future conformance delta.
8. Ensure `TERMINOLOGY_AXIS_CLARIFICATION.md` namespace aliases are used.
9. Ensure `RAW_EVIDENCE_EXCEPTION_CANONICAL.md` governs raw sidecars.
10. Preserve obsolete draft move / mark action from `OBSOLETE.md` without mutating DOI-bound baseline.

20.2 Future Mode B actions

If a full vo.1.1 or vo.2 release is created:

1. create release-copy files under a new versioned directory;
2. insert the short cross-reference block into relevant documents;
3. add clean-start fields to JSON schemas;
4. regenerate PDFs;
5. regenerate SHA256SUMS;
6. produce new release notes;
7. create new Zenodo version / DOI record if applicable;
8. preserve old DOI-bound vo.1 exactly.

20.3 Stop condition

Codex MUST stop and report if asked to:

- silently edit DOI-bound baseline files;
- replace clean-start wording without addendum trace;
- delete witness/legal records in examples;
- turn clean start into total erasure;
- turn clean start into automatic adult carryover;
- include raw child examples;

- weaken raw-evidence exception controls.

21. Addendum index entry

Suggested row for `CCDP_v0_1_1_ADDENDUM_INDEX.md`:

File	Role	Status	Mitigates
<code>CLEAN_START_CLARIFICATION.md</code>	Clarifies clean start as active adult continuity clean start, not destruction of minimal witness/legal/safety records or hidden adult carryover of childhood memory.	Draft addendum clarification	<code>HP-005</code> , <code>OI-006</code> , <code>CR-005</code>

22. Machine-readable manifest draft

```
clean_start_clarification:
  document_id: CLEAN_START_CLARIFICATION
  short_name: CS_CLARIFICATION
  version: v0.1.1-addendum
  date: 2026-06-13
  selected_patch_mode: MODE_A_ADDENDUM_ONLY
  baseline_mutation_allowed: false
  mitigates:
    - HP-005
    - OI-006
    - CR-005
  primary_rule: >
    Clean start means active adult continuity clean start, not unlawful
    destruction of minimal witness, safety, dispute, Red/Black, raw-evidence,
    jurisdictional, or legal-hold records.
  clean_start_modes:
    - CS-0
    - CS-1
    - CS-2
    - CS-3
    - CS-4
    - CS-5
    - CS-X
  required_event_family_prefix: ccdp.clean_start

```

23. Acceptance checklist

This document is acceptable if all checks pass:

- ☐ It does not edit DOI-bound baseline files.
- ☐ It clarifies clean start as active-plane exclusion, not total erasure.
- ☐ It prohibits hidden childhood carryover into `c_adult`.
- ☐ It preserves minimal witness / lawful / Red / Black / ARL / raw-exception records where required.
- ☐ It keeps surviving records outside active adult cognition by default.
- ☐ It distinguishes sealed archive from active memory.
- ☐ It requires memory-map review.
- ☐ It requires guardian visibility revocation.
- ☐ It requires adult explanation and adult decision.
- ☐ It requires witness event / decision record.
- ☐ It defines clean-start modes and invalid claim conditions.
- ☐ It includes conformance tests.
- ☐ It includes Codex carry-forward actions.
- ☐ It includes Mode A immutability constraints.

24. Final control statement

Clean start protects the adult from being governed by childhood memory.

It does not protect systems from accountability.

It does not erase lawful witness.

It does not let childhood silently continue under another name.

It creates a new active adult start while preserving only the minimal boundary records needed for safety, review, law, and proof that the boundary was respected.

Compact formula:

```
no hidden childhood operating system
no unlawful evidence destruction
no raw child life in adult default memory
```

minimal witness survives outside cognition
adult choice governs future continuity
