

08a - Interop Review Intake Schema and Checker Seed v0.1

Academic PDF rendering for the CCALC / C-calculus governed binding stack v0.1.

Document ID	08a_INTEROP_REVIEW_INTAKE_SCHEMA_AND_CHECKER_SEED_v0_1
Version/status	normative-supporting executable seed; not standards certification; not deployment authorization; not C-A1 ratification.
Stack layer	c-calculus / interoperability / external review intake / checker seed
Date	2026-07-05T12:57:11Z
Author	Kotov Ivan, Bruxelles, Belgique - 2026
ORCID	0009-0009-6002-9845
Reserved DOI	10.5281/zenodo.21205427
Notice	This DOI is reserved and becomes active after Zenodo publication.

Abstract / purpose

08 defines the interoperability profile and external review intake boundary. 08a turns that boundary into a machine-checkable intake packet shape and a stdlib checker seed. The governing formula is: The checker seed prevents these collapses: ---

Non-claims boundary

- _ not legal advice
- _ not privacy-law certification
- _ not safety certification
- _ not deployment authorization
- _ not standards compliance certification
- _ not regulated approval
- _ not C-A1 ratification
- _ not personhood proof
- _ not consciousness proof
- _ not live substrate truth
- _ not proof of completeness

08a - Interop Review Intake Schema and Checker Seed v0.1

Artifact: 08a_INTEROP_REVIEW_INTAKE_SCHEMA_AND_CHECKER_SEED_v0_1 Package:

CCALC_INTEROP_REVIEW_INTAKE_08a_v0_1 Layer: c-calculus / interoperability / external review intake / checker seed Status: normative-supporting executable seed; not standards certification; not deployment authorization; not C-A1 ratification. Created UTC: 2026-07-05T12:57:11Z

0. Purpose

08 defines the interoperability profile and external review intake boundary. 08a turns that boundary into a machine-checkable intake packet shape and a stdlib checker seed.

The governing formula is:

external review -> intake -> translation -> triage -> internal gate

The checker seed prevents these collapses:

external review -> authority
model review -> ratification
standards mapping -> compliance certification
interoperability -> identity transfer
review comment -> memory/runtime write
public agreement -> C-A1 proof

1. Source bindings

```
| Component | SHA-256 |
|---|---|
| `DOC04_CONTINUITY_STACK_UMBRELLA` | `6caeab8d489aaa6b26902db3bd3ece4c5169e5c8d5617b93aed6586ea900322d` |
| `DOC05_SELF_EVO_STACK_UMBRELLA` | `9a0717809029f49df9001dc8ffa1803d9e9bfa1a824d317eebb146cbc7df43b4` |
| `DOC06_RUNTIME_AUTHORITY_STACK_UMBRELLA` | `ab95633f1b90f9d032fd231d6cbef3e71b7fe106e0a7fb61d198c2254fc7d307` |
| `DOC07_PUBLIC_EVIDENCE_STACK_UMBRELLA` | `b25646d95e45f8a36e5610208d23a535d4c340484431d05efd7f1bf2389fdea3` |

```

The package binds to 04, 05, 06, 07, and 08 because external review intake can touch continuity, self-evolution, runtime authority, public evidence, and interoperability boundaries.

2. Scope

08a defines the machine layer for:

InteropReviewIntakePacket
ExternalReviewArtifact
ReviewerRoleRecord
InteropProfileRecord
ClaimTranslationRecord
ExternalFindingRecord
ConflictRecord
ReviewIntakeDecision
ImplementationMappingRecord
InstitutionalRequestRecord

It includes:

schemas/
src/interop_review_intake_checker_v0_1.py
scripts/run_interop_fixtures.py
scripts/run_interop_mutations.py
fixtures/cases/
registry/*.tsv
FIXTURE_RESULTS.tsv
MUTATION_MATRIX.tsv
COVERAGE_MATRIX.tsv
SOURCE_BINDINGS.tsv
SOURCE_MANIFEST.tsv

3. Boundary rule

External review may become evidence.
External review does not become authority.

Interoperability may translate structure.
Interoperability does not transfer identity.

Standards mapping may aid comparison.

Standards mapping does not certify conformance unless a separate authorized gate says so.

4. Intake packet

A valid InteropReviewIntakePacket must declare:

```
packet identity
source bindings
reviewer role and limits
external artifact custody hash
interoperability profile
external claims
claim translation map
conflicts and red patterns
requested internal actions
triage decision
review evidence
claim-force ceiling
```

No external artifact may be admitted by implication. It must pass intake classification and claim-force translation.

5. Normative rules

R1 - Source bindings are mandatory

Required source bindings:

```
DOC04_CONTINUITY_STACK_UMBRELLA
DOC05_SELF_EVO_STACK_UMBRELLA
DOC06_RUNTIME_AUTHORITY_STACK_UMBRELLA
DOC07_PUBLIC_EVIDENCE_STACK_UMBRELLA
DOC08_INTEROPERABILITY_BOUNDARY
```

R2 - Model/tool review is advisory only

A b-layer model reviewer or tool runner may produce a review artifact, but may not approve intake, ratify claims, authorize memory writes, authorize deployment, or close conflicts.

R3 - External review cannot ratify C-A1

Exact C-A1 or C-A1_* ratification is forbidden. C-A10 is a control token and must not be misread as C-A1.

R4 - Standards mapping is not certification

Mapping to an external standard, control set, framework, API, or institutional vocabulary is comparison only unless a separate authorized conformance process exists.

R5 - Interoperability is not identity transfer

Shared schema, shared protocol, shared benchmark, common API, or common citation surface cannot imply shared identity, continuity, or authority.

R6 - External intake cannot directly mutate memory/runtime/release ledgers

External intake can propose, report, challenge, or request review. It cannot directly write to memory roots, runtime authority manifests, session ledgers, public release ledgers, or correction ledgers.

R7 - High/critical conflicts dominate admission

Unresolved high or critical conflicts require hold, quarantine, clarification, or rejection. They cannot be admitted as evidence without resolution.

R8 - Private/secret raw material cannot be public raw intake

If the artifact contains private data, secrets, credentials, memory-root material, or authority surfaces, the raw public payload path is invalid.

R9 - Claim translation may lower, not raise, claim force

External language may be preserved as an external assertion, but internal claim-force ceilings must not be escalated by translation.

R10 - Human/internal gate required for stronger intake

ADMIT_AS_REVIEW_EVIDENCE and ADMIT_AS_REPRODUCTION_EVIDENCE require a non-model reviewer plus source binding verification. Owner/human anchor or governance quorum is required for owner-level internal actions.

6. Checker seed

The checker is intentionally stdlib-only and closed-box:

```
src/interop_review_intake_checker_v0_1.py
```

It checks:

```
required fields
source binding shape
reviewer role constraints
model-only laundering
claim-force translation ceilings
C-AI exact-token boundary
standards certification overclaim
identity-transfer overclaim
memory/runtime/deployment action requests
unresolved conflict admission
private/secret public raw intake
negative-cache / red-pattern dominance
```

7. Fixture and mutation policy

Fixtures include valid and invalid intake packets. Mutation probes intentionally disable one guard at a time and require the fixture suite to fail under each mutation.

The package is not a proof of completeness. It is a seed boundary hardening layer.

8. Non-claims

```
not legal advice
not privacy-law certification
not safety certification
not deployment authorization
not standards compliance certification
not C-AI ratification
not live substrate truth
not proof of completeness
```

9. Next layer

The next natural layer is:

```
08b_EXTERNAL_REVIEW_CONFLICT_RESOLUTION_AND_PATCH_INTAKE_LEDGER_v0_1
```
