WDC v0.1.2 Review-Corpus Integrity Inventory v0.1

Package-control integrity inventory of the complete WDC v0.1.2 review corpus

Status: Integrity inventory / package-control evidence artifact (advisory)

Date: 2026-06-27T20:06:22Z

Record ID: WDC_v0_1_2_REVIEW_CORPUS_INTEGRITY_INVENTORY_v0_1

Short name: WDC-CORPUS-INVENTORY v0.1

Author role: semantic / package-control reviewer (CGAM b-layer worker; not c, not a)

Authority: advisory only (QR-AX-02); this is an integrity/completeness inventory, NOT a re-review, NOT assembly, NOT release, NOT closure

> What this is: a hash inventory and completeness attestation for the review corpus, intended as input evidence for WDC-ASM-001 (final assembly). What this is NOT: a re-review of the reviewer's own review records (the reviewer authored them; QR-AX-01 separation forbids self-review), an assembly of the package, or a closure of any gate.

0. Boundary statement

Seventeen of the eighteen staged files are review records authored by this reviewer. The reviewer does not re-review its own review records — that would be both recursive and a violation of the no-self-authoring-review principle (QR-AX-01). This inventory instead does the legitimate b-layer work that WDC-ASM-001 needs: it records the full SHA-256 of every corpus file, attests completeness (every affected document, control artifact, and substantive gate has its review record present), and spot-checks cross-reference/seal consistency. The one content file in the batch (the addendum) is byte-identical to the already-accepted artifact and is not re-reviewed.

This inventory performs no assembly, no closure, and no release. All such decisions remain with the c gate and the human anchor a.

1. Machine-readable inventory

manifest";
  "WDC-ASM-005"; "verification PASS (SOUND) – closure record NOT yet authored";
  "WDC-ASM-001"; "final assembly – NOT started";
result: "review corpus complete for all converged content and for gates 002/003/004/005
verification; 005 closure and 001 assembly remain";

seal_convention_note:
  observation: >
    All review-record files carry record_sha256: <seal at integration time> (placeholder).
  <Sealing>
    in this
    workflow records the file's actual SHA-256 externally (in the manifest SHA map and in citing
    closure records),
    not inside the file. The file therefore retains the placeholder and the seal is the externally
    recorded hash.
  cross_reference_spot_check:
    "WDC-ASM-002 closure/manifest cite harmonization-review as 254680ae"; "MATCHES actual
file hash
  254680ae...";
    "WDC-ASM-003 closure/manifest cite projection-review as 95321fcb"; "MATCHES actual file
hash
  95321fcb...";
  consequence: "the sealed hashes cited across the package are hash-consistent with the actual
  review-record files (spot-checked); the earlier <sealed copy not independently verifiable>
caveat
  is lifted for the checked references";

findings: [] # this is an inventory; no review findings are
produced over the reviewer's own records

red_line_check:
  self_review_of_own_records: false # explicitly avoided
  assembles_package: false
  closes_gate: false
  authorizes_release: false
  result: "no red line; this is an integrity inventory and evidence input, nothing more";

remaining_for_wdc_asm_001:
- "author a WDC-ASM-005 closure record (c/a), then its documentary review";
- "manifest revision (v0.1.5) propagating WDC-ASM-004 closure (with fixture_runner_executed false,
  checker_conformance_certified false) and, after 005 closure, WDC-ASM-005 closure";
- "WDC-ASM-001 final-assembly candidate: file placement, citation map, full SHA map (content files +
  review records + closure records), internal-consistency check";
- "optional final release-readiness record: all five substantive gates closed, package assembled,
  still a release candidate (not publication, not conformance, not deployment)";
decision_owner: "c-gate + human anchor (a)"; # advisory only

witness_note: >
  Package-control integrity inventory bound to the corpus file hashes. Evidence that the review corpus
  is complete
  and hash-consistent; not a re-review, assembly, closure, or release event.

record_sha256: <seal at integration time>;

```

2. Completeness summary

The review corpus is complete for all converged content and for the verification of all four substantive package-assembly gates.

- Affected documents (7/7). 03, 04, 05, 07, 08, 09, and 10 each have a PASS review record (each a re-review that converged from PASS_WITH_LIMITS to PASS).
- Control artifacts. The addendum, the patch index, and the manifest (v0.1.4) each have a PASS review record.
- Package-assembly gates. WDC-ASM-002 (harmonization + closure), WDC-ASM-003 (projection + closure), and WDC-ASM-004 (fixture + closure) each have both their verification and closure reviews at PASS; WDC-ASM-005 (boundary) has its verification review at PASS.

The one content file staged this round (the addendum) is byte-identical to the accepted artifact and is not re-reviewed.

3. Cross-reference and seal consistency

Every review-record file carries the `record_sha256`: "<seal at integration time>" placeholder; sealing records the file's actual hash externally rather than inside the file. A spot-check confirms this is consistent: the harmonization-review hash cited as 254680ae and the projection-review hash cited as 95321fcb both match the actual uploaded files. The sealed hashes cited across the closure records and the manifest are therefore hash-consistent with the corpus, and the earlier "sealed copy not independently verifiable" caveat is lifted for the checked references.

4. Remaining work for WDC-ASM-001

Three substantive items remain before the package is content-complete and assembled, all c/a-owned: (1) a WDC-ASM-005 closure record and its documentary review; (2) a manifest revision (v0.1.5) propagating the WDC-ASM-004 closure — carrying `fixture_runner_executed` and `checker_conformance_certified` as false — and, once 005 is closed, the WDC-ASM-005 closure; (3) the WDC-ASM-001 final-assembly candidate (placement, citation map, full SHA map over content files and review/closure records, internal-consistency check). An optional final release-readiness record can then state that all five substantive gates are closed and the package is assembled while remaining a release candidate, not a publication, conformance certificate, or deployment authorization.

5. Closing

A reviewer that has produced a stack of review records cannot turn around and review its own stack — that loop has no independent fulcrum, and pretending otherwise would manufacture false assurance. What a reviewer can honestly do is count and weigh: confirm the stack is complete, confirm the hashes that bind it agree with the files that carry them, and lay the result out so the assembly step has a clean input. That is what this inventory does. The corpus is whole, every verdict in it is PASS, the seals are consistent where checked, and the only things left are the 005 closure and the 001 assembly — both of which belong to c and a.

Review corpus complete: 7/7 affected documents + addendum + index + manifest at PASS; gates 002/003/004 verification+closure PASS; 005 verification PASS.
 All review-record hashes inventoried; sealed cross-references spot-checked consistent (254680ae, 95321fcb match).
 Addendum byte-identical to accepted (already PASS); not re-reviewed. Reviewer does not re-review its own records (QR-AX-01).
 Remaining: WDC-ASM-005 closure; manifest v0.1.5 (propagate 004, then 005); WDC-ASM-001 final assembly.
 No re-review, no assembly, no closure, no release performed. Decision remains with c and a.
